

## Silt Fences

### Silt Fence

Silt fence is a temporary sediment barrier consisting of filter fabric entrenched into the soil and attached to support posts for efficient control of sediment run-off from construction sites.

Silt fence is a sediment control practice. It is intended to be installed adjacent to critical areas where sediment-laden water can pond, thus allowing the sediment to fall out of suspension and separate from the runoff. It is not intended to be an erosion control practice. Improperly applied or installed silt fence will increase erosion.

Silt fence along cut-off drain
